

Congratulations with your new **hopspots code:kit**!

You can now connect 3 Hopspots with the micro:bit. Below is a short guide. We hope that you will share your experiences with us (email them to [info@hopspots.dk](mailto:info@hopspots.dk)). Have fun!

1

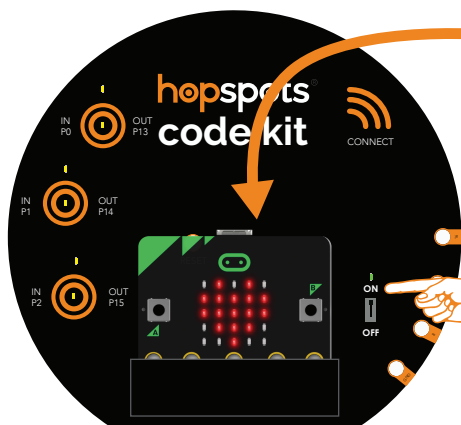

Transfer your code via cable to the micro:bit. Visit [www.microbit.org](http://www.microbit.org) to program your own game. Here you can choose inputs and outputs for 3 Hopspots-tiles. The first tile's input is on P0, and you can set its output on P13, such as light up in a specific color according to the colour scheme below.

You can also program a second tile on P1+P14 and the third tile on P2+P15.

2

Now insert the micro:bit into the code:kit

3

Turn ON by pushing up the white switch.

4

You can now connect the 3 Hopspots-tiles by holding one finger on CONNECT and another finger on the top tile icon. When pressing these at the same time the light above the icon starts to blink and you can now step on a tile. The tile is connected when the blinking light turns green. Continue with the other tiles.

5

You can now play your own games. Enjoy!
